Analysis of CDKN1C  in Beckwith Wiedemann syndrome.  

New p57KIP2 mutations in Beckwith-Wiedemann syndrome.  

Low frequency of p57KIP2  mutation in Beckwith-Wiedemann syndrome.  

CDKN1C  expression in Beckwith-Wiedemann syndrome patients with allele imbalance.  

Functional analysis of the p57KIP2  gene mutation in Beckwith-Wiedemann syndrome.  

Here we describe p57KIP2  mutations in patients with Beckwith-Wiedemann syndrome.  

An imprinted gene p57KIP2  is mutated in Beckwith-Wiedemann syndrome [see comments].  

Imprinting status of 11p15 genes in Beckwith-Wiedemann syndrome patients with CDKN1C  mutations.  

Is p57KIP2 mutation a common mechanism for Beckwith-Wiedemann syndrome or somatic overgrowth? [letter].  

Coding mutations in p57KIP2  are present in some cases of Beckwith-Wiedemann syndrome but are rare or absent in Wilms tumors.  

The gene encoding p57KIP2  is located at 11p15.5, a region implicated in both sporadic cancers and Beckwith-Wiedemann syndrome (BWS).  

In this study we have examined 32 patients with Beckwith Wiedemann Syndrome (BWS) for mutations affecting the CDKN1C  gene, including seven cases of familial BWS.  

The gene encoding p57KIP2  is located at 11p15.5 (ref. 2), a region implicated in both sporadic cancers and Beckwith-Wiedemann syndrome, a cancer-predisposing syndrome, making it a tumour-suppressor candidate.  

In contrast, p57KIP2 expression in cytotrophoblast and villous mesenchyme was absent or markedly decreased in 58 of 59 complete hydatidiform moles.  

We explored the utility of p57KIP2 as a diagnostic marker in hydatidiform mole, a
